

U. SHORES

Field Note U12a6. Archaeology - Fish traps – Struis Point

There are twenty-eight sites of intertidal fish trap clusters along the Cape South Coast, eight of which are along the shores of the Study Area. They are (from southwest to northeast): Suiderstrand, Rasperpunt, Cape Agulhas, Struis Bay, Struis Point, Ryspunt, Skipskop and Breede River, containing in total >100 traps of all shapes and sizes (Figure 1). This Field Note is about the traps in Struis Point (Figures 2 to 5).

Figure 5. Struis Point. View to the south.

The fish traps in Struis Point can be clearly seen in low tide (Figures 6 to 10).

Figure 6. Satellite image of Struis Point. Boxes, indicating fish trap clusters (white – northern; yellow – southern) are enlarged below.

Figure 7. Satellite image of the northern fish trap cluster. The cluster is sheltered.

Figure 8. Satellite image of the southern fish trap cluster. This cluster is subject to destructive wave and current action, and most of the walls are damaged.

PJ Hine, who investigated the antiquity of the traps, found in the Cape Archives many plans and sketches for the construction of fish traps submitted to the Cape authorities (Figure 11).

[From the internet]: The Struis Point beacon was erected on 28 September 1871, due to the number of ships striking Saxon Reef just off Struis Point. This beacon used to have a large copper ball on top that reflected the rays of the sun to the ships at sea. It is of great historical importance as it is the only known one of its kind ever erected (Figure 12).
