

M. SALT RIVER GORGE

Field note M4e. Morphology – Pinnacles

Pinnacles on the southern bank of the Salt River Gorge.

M. SALT RIVER GORGE

Field note M4e. Morphology – Pinnacles

[The formation of karst pinnacles on the Hard Dunes is discussed in Chapter E].

A cluster of several karst pinnacles on the Wankoe Formation is situated between Koleskloof and Gewanogatekloof (Figures 1 to 3). It is a unique feature of the Salt River Gorge, as no such cluster has been located anywhere on the Hard Dunes.

Figure 1. Topography map (top) and satellite image (bottom) of the Salt River Gorge. Arrow points to the pinnacles.

Figure 2. View from the northern bank of the Salt River Gorge across the Salt River Marsh on the pinnacles (yellow arrow), Gewanogatekloof (black arrow) and the Rooikrans (white arrow).

Figure 3. Pinnacles on the hillslope between Koleskloof and Gewanogatekloof.

Some pinnacles are 4-5 m high (Figures 4 and 5).

Fig 4. Top and bottom: some pinnacles attain heights of up to 5 m. The dry marsh floor is blooming.

Figure 5. Pinnacle, 5 m high.

Some pinnacles are partly hollowed out by erosion (Figures 6 and 7).

Figure 6. Hollowed-out pinnacle.

Figure 7. Top and bottom: eroded pinnacle bases.

Read on other pinnacles in Chapters E, O and P.
