

D. DURICRUSTS

Field Note D6c. Breede River terraces ferricretes

Ferricrete on a gravel terrace along the Breede River.

D. DURICRUSTS

Field Note D6c. Breede River terraces ferricretes

Ferricrete is abundant in the Study Area and ferricrete is present on some of the gravel terraces south of the Breede River (Figures 1 and 2).

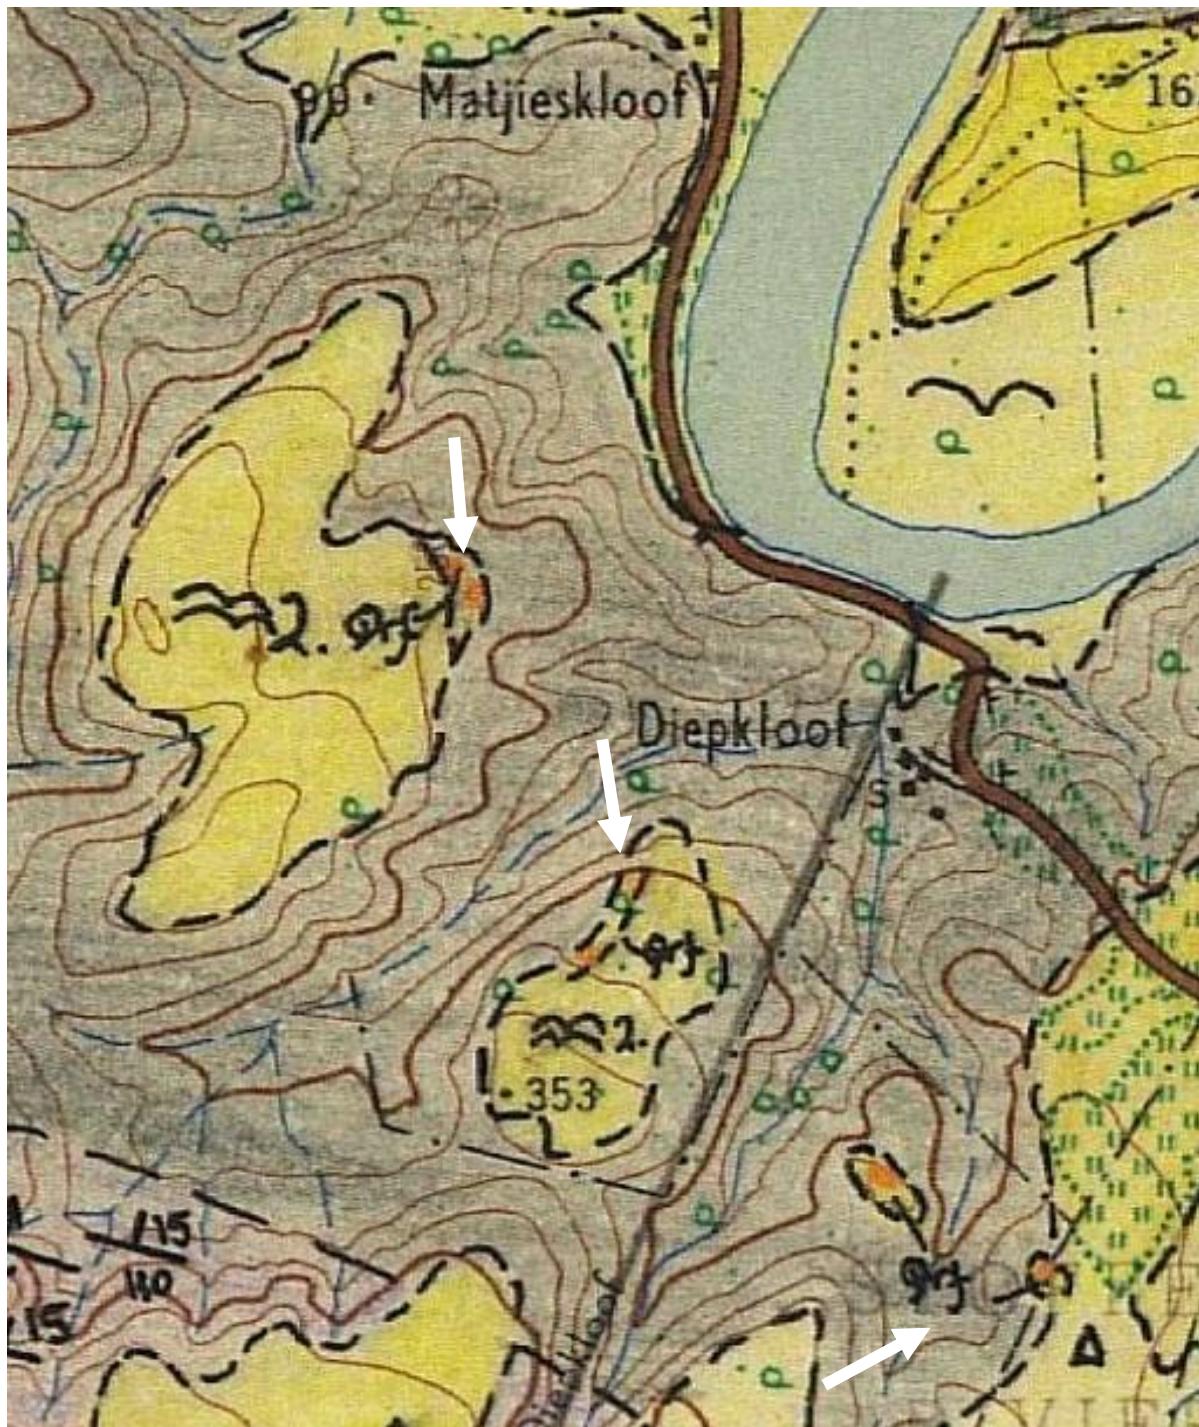

Figure 1. Geology maps (JA Malan, 1985) of a gravel terrace on the farm Diepkloof, south of the Breede River, showing ferricrete outcrops (arrows) at elevations of 90 - 100 m. The symbol Qrf stands for Quaternary ferricrete, (which could also be of Tertiary age). The symbol for terraces is:

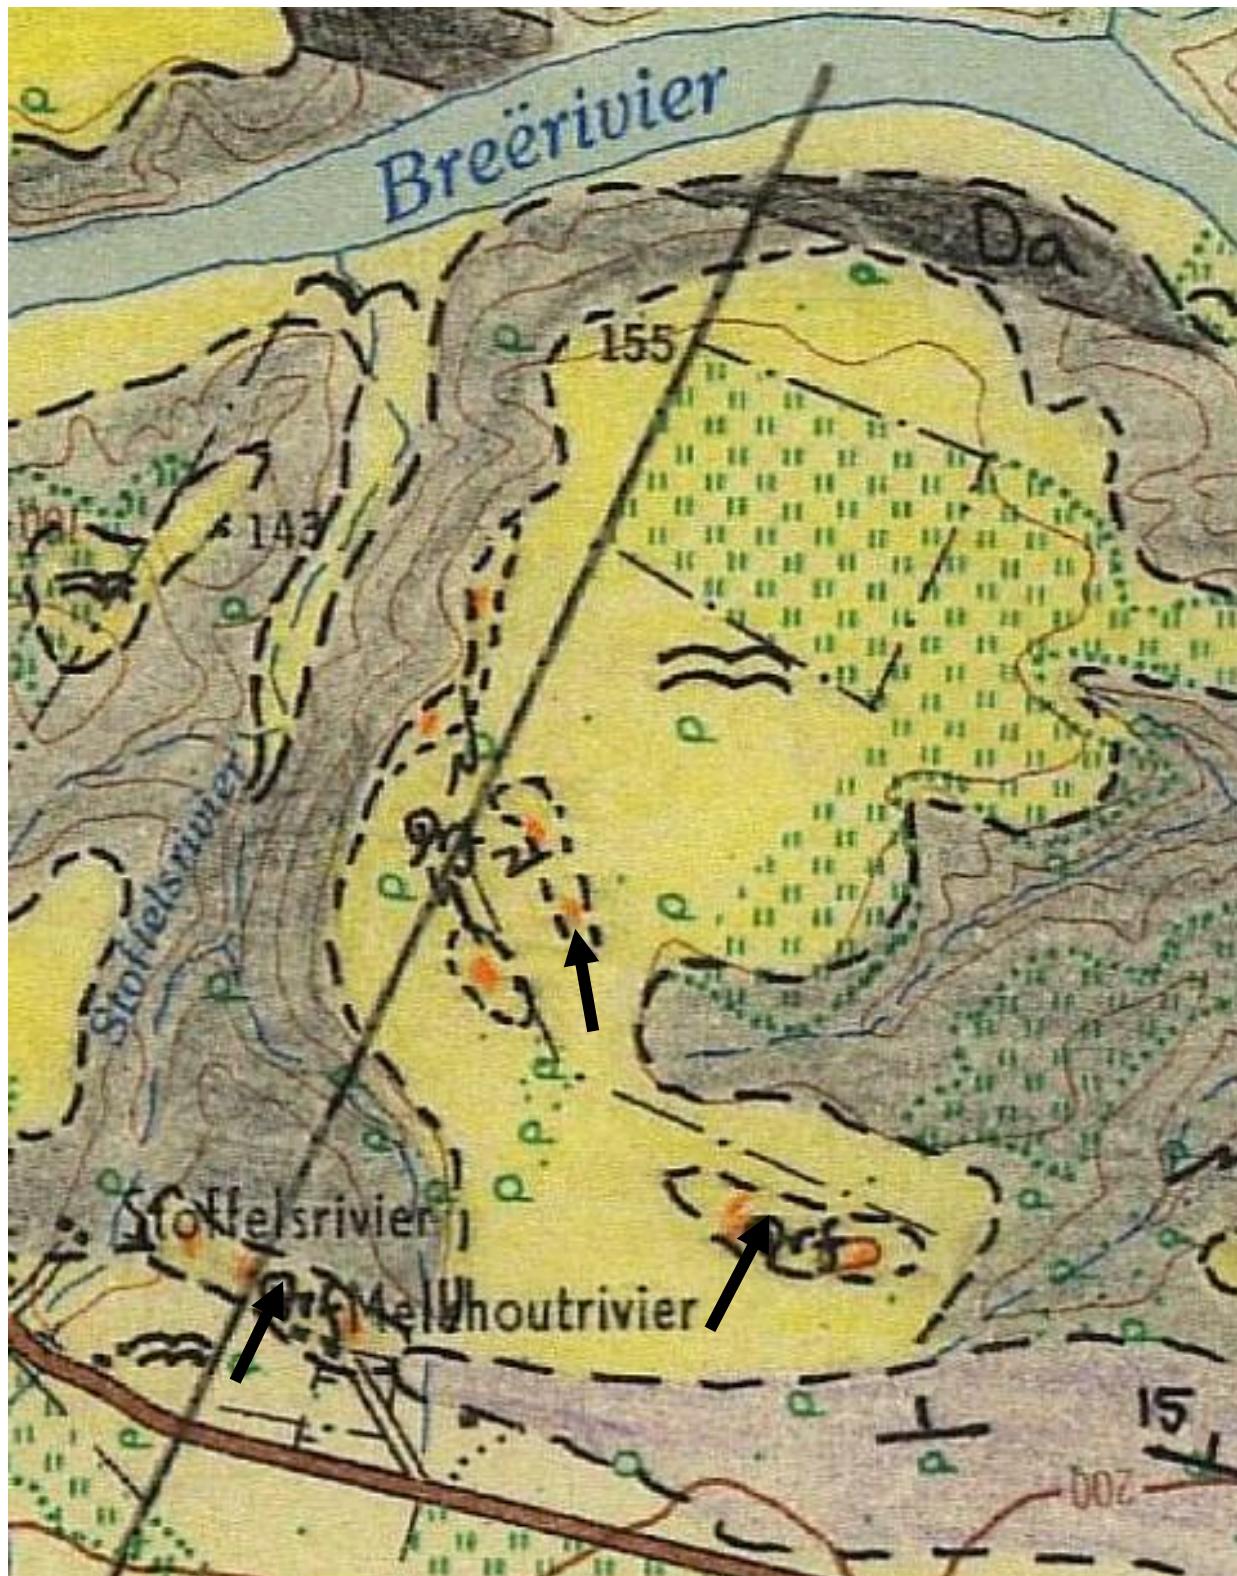

Figure 2. Geology maps (JA Malan, 1985) of a gravel terrace on the farm Melkhoutrivier, south of the Breede River, showing ferricrete outcrops (arrows) at elevations of 50 - 60 m. The symbol Qrf stands for Quaternary ferricrete (which could also be of Tertiary age). The symbol for terraces is:

The ferricrete is present in four main forms: a. ferruginised gravel, b. ferricrete nodules, c. massive ferricrete and d. ferricrete as cement of conglomerate (Figures 3 and 4).

Figure 3. Ferricrete forms: top – ferruginised gravel. Bottom – ferricrete nodules (the small, black pebbles).

Figure 4. Ferricrete forms: top – massive. Bottom – conglomerate.
